Installing Photoshop is relatively easy. First, you'll need to download the software from Adobe's website. Normally, you can do this by opening Adobe's site and searching for Photoshop. Next, download the software and extract it. Once the software is installed, you need to run the program. After this, you can open the program and start using it. If you find that you want to make changes, you need to update the software. This usually happens when Adobe releases a new version of Photoshop and you need to update it.

There's a new Speed Panels panel in the Develop module that includes a ruler to align your photos, period and strobe histograms to help you see the light in your images (more on this next), and an Exposure tab for judging whether you've got the most accurate exposure. The new Trust tool shows you an overlay of the original image and its copies – you can invert the overlay to check the luminance and color balance of each copy. (Sure, there are apps that do this — but running them on your big computer takes a lot of time and memory.) Trust allows you to quantitatively compare similar areas of multiple copies and determine if copies are accurate or need further improvement. The Magic Wand tool matches pixels of similar color in both images and gets rid of distracting details. You can select a range of photo areas and then refine them. There's a range of sliders for the contransformation degree and tolerance to perform the Magic Wand; as well as a Dual Mode, which switches back and forth between a alpha channel and color channels, in one pass.
